

PANCERA: 30 years of Experience at Drilling Contractors' Service

PANCERA TUBI E FILTRI is a competitive and dynamic company working in the artesian wells products field since 1976. Today, the company is a still expanding reality, the prime factors of its success are the choice to offer high quality products and the particular attention paid to customers' satisfaction.

The product range is wide and diversified and includes PVC pipes and screens from diam. 33,3 mm to diam. 630 mm. Carbon and stainless steel pipes and screens from diam. 114,3 mm to diam. 1016 mm. HDPE pipes and screens from diam. 32 mm to diam. 630 mm, accessories and drilling fluids.

The latest news concerning products are the biodegradable socket and the PVC riser pipe for submers-

ible pump. The socket, of vegetable origin, has been designed to place the drainage gravel right around the screen. To do so the drainage is poured inside the socket before the latter is lowered into the well, then, once the socket is placed around the screen, it dissolves in a short time leaving there only the drainage gravel. The riser pipe for submersible pump is cheaper than usual steel pipes used for this purpose as it is made of PVC, however, it offer the same performance.

The company is also constantly aimed at acknowledging the signals coming from the market and it is always ready to turn them into innovative ideas and products. From this point of view the geothermal market is the most recent challenge for company PANCERA, which has

started a production line of geothermal probes, grouts and accessories, giving concrete reply to the always increasing demand of such products. ■
